

AGENDA

LINDSTROM CITY COUNCIL WORK SESSION

TUESDAY, MAY 2, 2023 5:00 P.M. Lindstrom City Hall 13292 Sylvan Ave., Lindstrom, MN

CALL TO ORDER/PLEDGE:

GENERAL BUSINESS ITEMS:

- 1. Charitable Gambling (pgs. 2-8)
- 2. Pavement Management (pgs. 9-32)
 - a. Engineer's Report
 - b. Irene Avenue Pavement Improvements Bid Tabulation
 - c. Irene Avenue Typical Section
 - d. Geotechnical Report
- 3. South Lindstrom Lake Sanitary Sewer Lining (pgs. 33-35)

ADJOURNMENT:

20 Lake St. N. Suite 103 Forest Lake, MN 55025 Phone: (651) 464-3685 • Fax: (651) 464-3687 www.lc4yf.org

April 10, 2023

To: City of Lindstrom City Council

From: Linda M. Madsen JMM Executive director

RE: Request for Approval to Conduct Lawful Gambling at the Chisago Lakes Grill, Lindstrom, MN

Lakes Center for Youth and Families is requesting approval to conduct charitable gambling at the Chisago Lakes Grill in Lindstrom, MN. We currently conduct charitable gambling at Running Aces in Columbus, MN and have done so since 2012.

We have been working with the Chisago Lakes Grill Board of Directors to fill out the required paperwork (LG214 and LG215) which is attached. Since we are currently licensed, these are the two forms necessary to present to the City Council. Also included is the list from the Gambling Control website which indicates Lakes Center is licensed.

Thank you for considering this request.

24 April 2023

This letter is to affirm the decision of the Board of Directors of Chisago Lakes Golf Estates, Inc. dba Chisago Lakes Golf Course and Chisago Lakes Grill at 12975 292^{ad} Street. This relates to the provision of charitable gambling materials.

In the past, this service has been provided by Lakes Area Recreation Association.

Our desire is to have these services now provided by the following:

Lakes Center for Youth & Families 20 Lake Street North, Suite 103 Forest Lake, MN 55025 Phone 651-464-3685, ext. 109 Fax 651-464-3687

Chief Executive Officer: Linda Madsen (651-464-3685) Gambling Manager: Kathy Lillis (651-248-7757) Gambling license: 34511

If any additional information is required, please request same.

Carlton R. Erickson President, Board of Directors Chisago Lakes Golf Estates, Inc.

LG215 Lease for Lawful Gambling Activity

Management: The owner of the premises or the lessor will not manage the conduct of lawful gambling at the premises. The organization may not conduct any activity on behalf of the lessor on the leased premises.

Participation as Players Prohibited: The lessor will not participate directly or indirectly as a player in any lawful gambling conducted on the premises. The lessor's immediate family and any agents or gambling employees of the lessor will not participate as players in the conduct of lawful gambling on the premises, except as authorized by Minnesota Statutes, Section 349.181.

Illegal Gambling: The lessor is aware of the prohibition against illegal gambling in Minnesota Statutes 609.75, and the penalties for illegal gambling violations in Minnesota Rules 7865.0220, Subpart 3. In addition, the Board may authorize the organization to withhold rent for a period of up to 90 days if the Board determines that illegal gambling occurred on the premises or that the lessor or its employees participated in the illegal gambling or knew of the gambling and did not take prompt action to stop the gambling. Continued tenancy of the organization is authorized without payment of rent during the time period determined by the Board for violations of this provision, as authorized by Minnesota Statutes, Section 349.18, Subd. 1(a).

To the best of the lessor's knowledge, the lessor affirms that any and all games or devices located on the premises are not being used, and are not capable of being used, in a manner that violates the prohibitions against illegal gambling in Minnesota Statutes, Section 609.75.

Notwithstanding Minnesota Rules 7865.0220, Subpart 3, an organization must continue making rent payments under the terms of this lease, if the organization or its agents are found to be solely responsible for any illegal gambling, conducted at this site, that is prohibited by Minnesota Rules 7861.0260, Subpart 1, item H, or Minnesota Statutes, Section 609.75, unless the organization's agents responsible for the illegal gambling activity are also agents or employees of the lessor.

The lessor must not modify or terminate the lease in whole or in part because the organization reported, to a state or local law enforcement authority or to the Board, the conduct of illegal gambling activity at this site in which the organization did not participate.

ACKNOWLEDGMENT OF LEASE TERMS

Other Prohibitions: The lessor will not impose restrictions on the organization with respect to providers (distributor or linked bingo game provider) of gambling-related equipment and services or in the use of net profits for lawful purposes.

The lessor, the lessor's immediate family, any person residing in the same residence as the lessor, and any agents or employees of the lessor will not require the organization to perform any action that would violate statute or rule. The lessor must not modify or terminate this lease in whole or in part due to the lessor's violation of this provision. If there is a dispute as to whether a violation occurred, the lease will remain in effect pending a final determination by the Compliance Review Group (CRG) of the Board. The lessor agrees to arbitration when a violation of this provision is alleged. The arbitrator shall be the CRG.

Access to Permitted Premises: Consent is given to the Board and its agents, the commissioners of revenue and public safety and their agents, and law enforcement personnel to enter and inspect the permitted premises at any reasonable time during the business hours of the lessor. The organization has access to the premises during any time reasonable and when necessary for the conduct of lawful gambling.

Lessor Records: The lessor must maintain a record of all money received from the organization, and make the record available to the Board and its agents, and the commissioners of revenue and public safety and their agents upon demand. The record must be maintained for 3-1/2 years.

Rent All-Inclusive: Amounts paid as rent by the organization to the lessor are all-inclusive. No other services or expenses provided or contracted by the lessor may be paid by the organization, including but not limited to:

- trash removal
- electricity, heat
- snow removal
- storage
- janitorial and cleaning services
 other utilities or services
- other utilities
 lawn services
- security, security monitoring
- cost of any communication network or service required to conduct electronic pull-tabs games or electronic bingo
 in the case of bar operations, cash shortages.

Any other expenditures made by an organization that is related to a leased premises must be approved by the director of the Board. Rent payments may not be made to an individual.

	between the lessor and the organization, and that all obligations and nd are subject to the approval of the director of the Gambling Control Board.

Honorable Mayor and City Council Members
Ms. Melissa Glenna, Interim City Administrator
Matt Fraley, Director of Public Works
Jon Herdegen, P.E. – City Engineer
Pavement Management
April 28, 2023 – For the May 2 nd Council Work Session

Continuing our recent discussions of the City's pavement management plan, staff has prepared some additional information we are excited to present to the Council and solicit your feedback. We would like to review the following items during our May 2nd Work Session:

- Pavement Criticality Ratings
- Street Designation Groups
 - Maintenance
 - Reclamation
 - Street Reconstruction
 - o Street & Utility Reconstruction
- Irene Avenue Pavement Improvements
 - Geotechnical Report
 - Improvement Options
- 2023 Budget & Future Projects
 - Neal Avenue Pavement Improvements

Pavement Criticality Ratings

The City of Lindstrom has incorporated a form of criticality weighting into their pavement management approach since 2018. The criticality score is based on a set of weighted factors – safety, street category, impact, traffic volume, and street age. The factors were largely determined by the City Staff and the former Public Works Committee, with input from MSA based on industry best practices. The list below describes each factor in more detail:

- Safety: Six variable analysis per road segment, created by John Olinger which incorporated considerations such as blind corners, steep ditch grades, accident history, etc.
- Street Category: Similar to functional classification but customized to accommodate a smaller city with more granular needs. Categories by decreasing priority are Downtown, Business, Collector, Neighborhood, Dead End, Cul-de-sac, Alley, Industrial and Gravel.
- Impact A factor used to account for the types of activities, institutions, and access each road serves taking into account the City's non-grid layout. Categories by decreasing priority are Business, Schools, Churches, Public Facilities, Recreation, Industrial and Residential
- Traffic Volume Industry standard metric of criticality. Lacking available traffic count data on every road segment, City Staff provided High, Medium, or Low assignments of traffic volume to each segment.

City Council Work Session May 2, 2023 Page 9 of 35 • Street Age – Used primarily as a tie breaker metric in the event new streets and old streets were to yield a similar criticality score. The street age score would promote an investment on the older street.

Each of these factors were weighted to form the basis for the Criticality score as follows:

- Traffic Volume 112
- Street Category 95
- Impact 85
- Safety 70
- Street Age 5

Criticality scores were migrated to Cartegraph in 2021 and broadened to from a 1-10 scale to a 1-100 scale. Some adjustments were made to ensure balance and prevent overweighting of a single factor due to how Cartegraph handles the street category variability. The 2023 analysis within Cartegraph utilizes additional improved mechanisms to assist with expressing criticality beyond the score itself. MSA is utilizing the street category as the functional classification and is able to set minimum levels of service for each of these categories to promote proper balance of investment forecasting. Staff plans to share an itemized summary of the criticality score for each street segment in tabular form as well as on an interactive web map.

Street Designation Groups

Based on feedback received from Council at the April 4th work session, staff has worked to develop four (4) street designation groups to assist in prioritizing projects and appropriately allocating resources. The following is a high-level description of each designation group which staff plans to expand upon during the work session:

- Maintenance Group This group includes streets that have an OCI (Overall Condition Rating) between ~70-100. These segments are our "good" streets. Using Cartegraph, we have applied our preferred maintenance schedule and associated costs to development proposed annual budgets based on an average and final OCI over a 20-year period.
- Reclamation Group This group reflects streets that are deficient only from a pavement condition standpoint. The
 underlying utilities (water and sanitary sewer) are in good condition and the stormwater management in functional.
 From Staff's perspective, applying the standard pavement maintenance practices to these streets are not cost
 effective because they are too far gone. The pavement surface must be replaced. We recommend implementing a
 full depth reclamation for these streets. Based on the bid prices recently submitted for the Irene Avenue Pavement
 Improvements project, we can estimate the total project costs for these qualifying segments.
- Street Reconstruction This group shares the same characteristics as the reclamation group with a critical exception: the alignment and profile is not suitable to effectively manage stormwater. Estimating the replacement costs of this designation group is more difficult given the variable factors for each segment.
- Street and Utility Reconstruction This group is a summary of our worst and most-expensive streets to reconstruct. The pavement management budget alone is unlikely to be able to support reconstructing these segments and additional funding sources will be needed to make meaningful improvements.

Staff has development an interactive web map to depict each designation group and the factors that contributed to our decision-making process. Applying unit costs to each designation group, will hopefully provide some perspective to assist advancing the City's pavement management plan.

Irene Avenue Pavement Improvements

Staff presented bid results for the Irene Avenue Pavement Improvements project at the April 20th Council meeting. Council decided to table the consideration of award until further discussion could take place at this work session. For reference, here are a summary of the bid results:

Storm Sewer Improvements

- Status: Awarded, Not Constructed
- Contractor: Gustafson Excavating

• Construction Cost: \$37,349.40

Pavement Improvements

- Status: Not Awarded, Not Constructed
- Contractor: Bituminous Roadways
- Construction Cost Reconstruction Alternative: \$344,379.80 (~\$48/SY)
- Construction Cost Reclamation Alternative: \$254,606.20 (~\$35/SY)

Construction Administration & Observation (Engineering)

• \$30,000-\$38,000

Enclosed for your review is a copy of the Geotechnical Report prepared for the Irene Avenue Improvements project. Council expressed concern regarding some of the findings contained within the report. On page 6 of the report, the geotechnical engineer provided the following recommendation:

"We understand that the existing paving materials would ideally be milled to create a blended materials with a gradation comparable to class 5 aggregate base and used to support the new pavements. Whereas the materials below the bituminous appear to consist of materials which are dirtier and less gravelly than conventional aggregate base, we presently recommend limiting milling to the asphalt layers."

The work described in the Reconstruction Alternative reflects the recommendations of the geotechnical report. The Reclamation Alternative proposes to mill the bituminous pavement and mix it with the underlying silty sand with gravel material. Since this alternative was contrary to the recommendations of the geotechnical engineer, staff reached out to a contractor that specializes in pavement reclamation. Upon review of the soils boring for the project, the contractor was confident that they would be able to effectively control the depth of the mill to prevent generating unsuitable material. To be clear, the full pavement reconstruction alternative will generate a more durable pavement section. However, staff recommended the Reclamation Alternative as is represented a 20% construction cost savings with a marginal reduction in overall durability.

2023 Budget & Future Projects

The remaining 2023 street improvements budget is approximately \$660,000. Staff is recommending that the City proceeds with the Storm Sewer and Pavement Improvements (Reclamation Alternative) on Irene Avenue. The total project cost (including construction cost and construction administration and observation) is \$322,000. Staff recommends that a portion of the remaining budget is allocated to another pavement reclamation project.

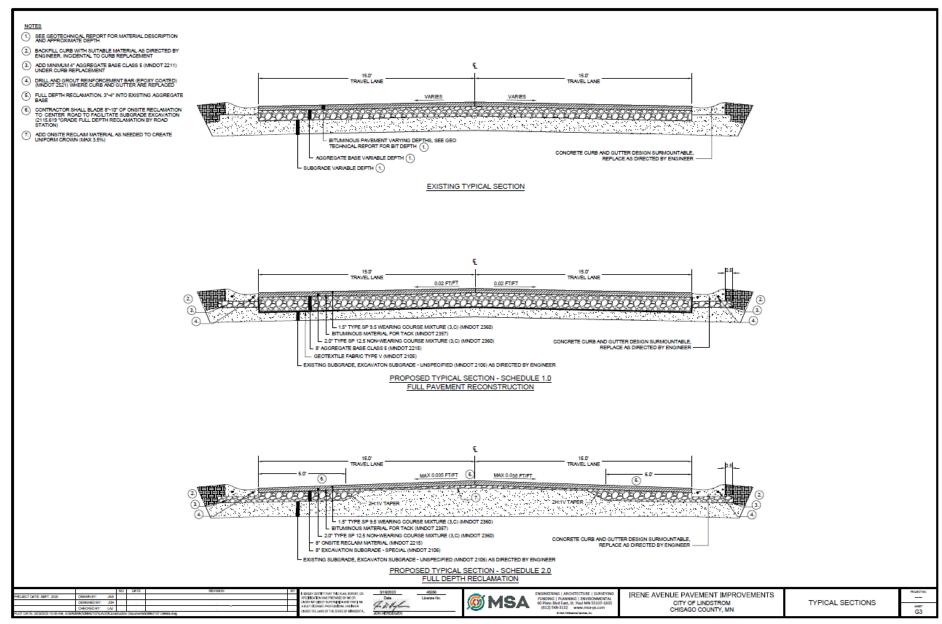

- Project Location: Neal Avenue between 295th Street & 297th Street
- Project Area: 5,681 SY
- Construction Cost: \$198,835 (\$35/SY)
- Contingencies: \$40,000 (~20%)
- Engineering: \$30,000(~15%)
- Total Project Cost: \$268,835
- Remaining 2023 Budget: \$69,165*

*Costs associated with Irene Ave Storm Sewer (\sim \$41,000 – construction costs + engineering) may be taken from the storm water budget rather than streets budget. This change would increase the remaining streets budget to \sim \$110,000.

> Re: Design Phase Geotechnical Evaluation Proposed Lindstrom Street Improvements 2022 Irene Avenue Lindstrom, Minnesota CVT Project 19585.21.MNT

Dear Mr. Herdegen,

As requested, we have prepared the design phase geotechnical evaluation for the proposed project in Lindstrom, Minnesota. This letter briefly summarizes the findings in the attached report.

Summary of Boring Results

At the surface, the borings encountered about 2 to 4 $\frac{1}{2}$ inches of bituminous pavement. This was underlain by about $\frac{1}{2}$ to 2 feet of fill consisting of silty sands with gravel, which did not appear to sufficiently coarse to meet requirements for aggregate base.

Beneath the silty sand with gravel fill, Boring B-9 encountered clayey sand which contained lenses and layers of organic soils. This boring is near a culvert connecting drainage of the mapped marshy area west of the roadway to the North Center Lake. The upper 9 feet of materials appeared to be fill materials while the deeper materials appeared to be more likely natural deposits.

The dominant soils at depth in the other borings consisted primarily of silty to clayey sands. The northernmost boring was the notable exception and met a layer of lean clay between the silty sand fill and the deeper natural silty to clayey sands.

Free groundwater was only observed in the boring with the deep fill and organic layers approximately 13 ½ feet below the surface. The moisture content data and soil colorations do not appear to suggest continuous exposure to water at the other locations and depths. Groundwater levels at the site are expected to fluctuate seasonally with local weather patterns and similar to levels in the nearby rivers, lakes, and creeks.

LINDSTROM STREET IMPROVEMENTS 2022 PROJECT #: 19585.21.MNT FEBRUARY 26, 2022 Page - 2

Summary of Analysis and Recommendations

As mentioned earlier, the pavement subgrade soils are expected to primarily consist of silty clayey sands, silty sands, and clayey sands. If utilities are planned for this project, the dominant soils appear suitable for support of piping and for reused as backfill. Dewatering is not expected to be needed for shallow utility excavations.

Based on the data, milling of the existing paving materials is recommended to be limited to the surficial asphalt. The soils expected to be exposed after stripping to the bottom of the pavement subgrade are expected to suitable for support of the replacement pavement. We recommend using an R-value of 20 for pavement design on the expected soils. The report includes a recommended pavement section based on assumed loading conditions. We understand that the typical pavement section for City of Lindstrom includes placement of a 1-foot layer of clean sand below the paving materials as well as edge drains. Our understanding is that this is not incorporated in the existing street section. Based on the data, the recommended pavement section described provides greater overall strength than the existing pavement and would not significantly benefit from either edge drains or an additional sand layer below the aggregate base. The pavement recommendations provided should be considered preliminary, subject to review by the civil engineering consultant, and their experience with pavement design and performance in the area of the project.

<u>Remarks</u>

We appreciate the opportunity to serve you. The attached report provides more details of our analysis. If you have any questions about our report, please feel free to contact us at (320) 774-3500.

Sincerely, Chosen Valley Testing, Inc.

Design Phase Geotechnical Report Proposed Lindstrom Street Improvements Irene and Peninsula Aveenues Lindstrom, Minnesota

CVT Project Number: 19585.21.MNT Date: February 26, 2022

A. Introduction

The intent of this report is to present our results to the client in the same logical sequence that led us to arrive at the opinions and recommendations expressed. Since our services must often be completed before the design, assumptions are sometimes needed to prepare a proper evaluation and to analyze the data. A complete and thorough review of this entire document, including the assumptions and the appendices, should be undertaken immediately upon receipt.

A.1. Purpose

This report was prepared to assist planning for the proposed street improvements along Irene Avenue and Peninsula Avenue in Lindstrom, Minnesota. Our services were authorized by Mr. Jon Herdegen, P.E., City Engineer, of MSA Professional Services, Inc.

A.2. Scope

To obtain data for analysis, a five (5) borings were performed along Irene Avenue. The borings were drilled to depths of about 14.9 feet below the surface. Our engineering scope consisted of providing geotechnical recommendations for the proposed pavement improvements.

A.3. Boring Locations and Elevation

The boring locations were indicated to Chosen Valley Testing (CVT) on a site map provided and were offset as needed to avoid existing utilities marked by surveyors. The Boring Location Sketch in the Appendix shows the approximate locations as drilled which have been plotted onto aerial imagery using Google Earth Software.

The ground surface elevations at the borings were estimated to the nearest 1 foot from Minnesota Department of Natural Resources LiDAR topographic data using their online software "MnTOPO" and should be considered approximate.

A.4. Geologic Background

A geotechnical report is based on subsurface data collected for the specific structure or problem. Available geologic data from the region can help interpretation of the data and is briefly summarized in this section.

Geologic maps indicate that the soils on site consist of a low relief silty clayey sand till of unsorted pebbly sediment which border a mapped zone of peat and muck dominated by fine grained organic matter and calcareous clay at depth. Geologic maps indicate bedrock being on the order of 300 to 400 feet below the

MINNESOTA IOWA WISCONSIN

Page - 3

Febru

surface with bedrock expected to be yellow to gray very fine-grained feldspathic sandstone, siltstone, and shale of the Eau Claire Formation.

B. Subsurface Data

Methods: All of the borings were performed using penetration test procedures (Method of Test D1586 of the American Society for Testing and Materials). This procedure allows for the extraction of intact soil specimen from deep in the ground. With this method, a hollow-stem auger is drilled to the desired sampling depth. A 2-inch OD sampling tube is then screwed onto the end of a sampling rod, inserted through the hole in the auger's tip, and then driven into the soil with a 140-pound hammer dropped repeatedly from a height of 30 inches above the sampling rod. The sampler is driven 18-inches into the soil, unless the material is too hard. The samples are generally taken at 2½ to 5-foot intervals. The core of soil obtained is classified and logged by the driller and a representative portion is then sealed in a jar and delivered to the soils engineer for review.

B.1. Stratification

At the surface, the borings encountered about 2 to 4 ½ inches of bituminous pavement. This was underlain by about ½ to 2 feet of fill consisting of silty sands with gravel, which did not appear to sufficiently coarse to meet requirements for aggregate base.

Beneath the silty sand with gravel fill, Boring B-9 encountered clayey sand which contained lenses and layers of organic soils. This boring is near a culvert connecting drainage of the mapped marshy area west of the roadway to the North Center Lake. The upper 9 feet of materials appeared to be fill materials while the deeper materials appeared to be more likely natural deposits.

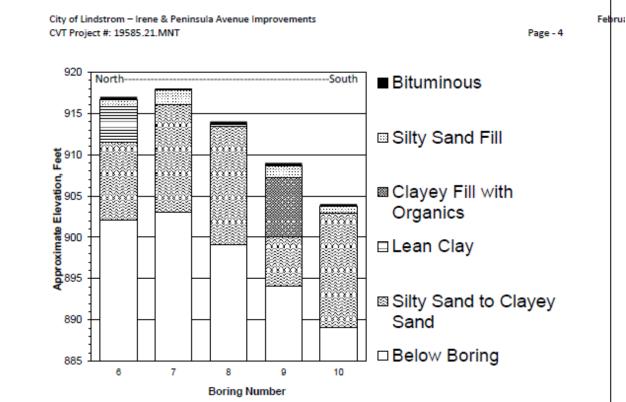

The dominant soils at depth in the other borings consisted primarily of silty to clayey sands. The northernmost boring was the notable exception and met a layer of lean clay between the silty sand fill and the deeper natural silty to clayey sands.

The boring data has been summarized in the following cross-section. For more detailed information, please refer to the individual Log of Boring sheets in the Appendix.

MINNESOTA

IOWA

WISCONSIN

B.2. Penetration Test Results

The number of blows needed for the hammer to advance the penetration test sampler is an indicator of soil characteristics. The number of blows to advance the sampler 1 foot is called the penetration resistance or "N"-value. The results tend to be more meaningful for natural mineral soils, than for fill soils. In fill soils, compaction tests are more meaningful.

The uppermost soils in the borings were frozen, and penetration test values in that zone were not meaningful. Penetration resistance values (N-values) of 7 and 8 Blows per Foot (BPF) were recorded in the un-frozen fill soils. Values in the un-frozen natural soils ranged from 6 to 25 BPF, indicating they were loose to medium dense. The higher values tended to be recorded at depth.

A key to the descriptors used to qualify the relative density of soil (such as *soft, stiff, loose*, and *dense*) can be found on the Legend to Soil Description in the Appendix.

B.3. Groundwater Data

During the drilling operation, the drillers may note the presence of moisture on the sampling instrument, in the cuttings, or within the borehole. These observations are recorded on the boring logs. The water level may vary with weather; time of year and other factors and the presence or absence of water during the drilling is subject to interpretation and is not always conclusive.

Free groundwater was only observed in Boring B-9, the borings with the deep fill and organic layers, and was noted approximately 13 ½ feet below the surface. The soils in all of the borings were not very permeable and would tend to inhibit flow of water into the bore holes. That said, the moisture content data and soil

MINNESOTA IOWA WISCONSIN

Page - 5

Febru

colorations do not appear to suggest continuous exposure to water the other locations and depths. Groundwater levels at the site are expected to fluctuate seasonally with local weather patterns and similar to levels in the nearby rivers, lakes, and creeks.

C. Project Design Data

Each structure has a different loading configuration and intensity, different grades, and different structural and performance tolerances. Therefore, the geotechnical exploration will be construed differently from one structure to another. If the initial structure should change design, we should be engaged to review these conditions with respect to the prevailing soil conditions. Without the opportunity to review any such changes, the recommendations may no longer be valid or appropriate.

Grading and utility plans were not provided. The proposed project is understood to consist primarily of replacing the pavements along Irene Avenue and Peninsula Avenue between Olinda Trail N and Irene Street in Lindstrom, Minnesota. Grades are to remain near existing grades, to preserve existing curbs. We assumed that any utilities that might be placed or upgraded will be installed around 5 to 7 feet below the surface using open cut excavation.

Traffic information was not provided. For purposes of analysis, we assumed a daily ADT of less than 300 vehicles per day.

D. Utility Recommendations

D.1. Groundwater/Dewatering

As mentioned earlier, water was observed in Borings B-9 around 13 ½ feet below the surface during our exploration but was not noted on the other borings and the overall soils encountered were not highly permeable. On this basis, sump pumps should be capable of removing any precipitation or seepage that may pond in excavations. Excavations that extend into water bearing sands or gravels, if met, would likely require aggressive water removal techniques, such as well points or monitoring wells, in order to keep excavations dry.

D.2. Trench Sidewalls

The contractor will be required to slope or shore the excavations as needed to meet OSHA requirements for safety. The on-site clayey sands and silty clayey sands are expected to classify as Type C or B soils. Depending on the depth of the trenches and proximity to structures or other property constraints, trench boxes or other stabilization methods may be required.

D.3. Trench Bottom Stability

Utilities are expected to bear on materials consisting primarily of clayey sands and silty clayey sands, though some softer or weaker zones (organic layers) were noted at one location. The dominant materials are expected to be generally suitable for support of utilities. If unstable materials are present at invert elevations,

MINNESOTA IOWA WISCONSIN

Page - 6

Febru

they should be replaced as needed with clean sand or gravel having less than 12% particles passing a number 200 sieve as engineered fill, subject to the conditions observed. Neither extensive nor deep replacements are expected to be necessary.

Cobbles, boulders, and bedrock should be removed from at least ½ to 1-foot away from utilities and replaced with clean sands or gravels that can more readily conform to the pipe to prevent point loads and possible rupturing.

D.4. Fill Placement and Compaction

The soils available for use as fill above pipes are also expected to consist primarily of silty to clayey sands and less amounts of clay and even lesser amounts of organic soils. Most of the excavated materials are expected to be suitable for reuse as backfill above the pipes, provided they can be adequately compacted. Again, any cobbles or boulders should be kept at least ½ to 1-foot away from pipes, to limit potential for point loads.

In areas that will receive pavements, we recommend backfilling the upper portion of trenches with soils similar to the surrounding subgrade. This is in an attempt to provide a uniform supporting pavement subgrade. The upper most soils encountered within the borings consisted primarily of silty sands with gravel. Soils placed as backfill below paved areas should ideally be compacted to 100% of their standard Proctor density (ASTM D 698) in the upper 3 feet and to at least 95% below. In green areas, 90% compaction is normally adequate.

E. Paved Area Recommendations

E.1. Stripping and Grading

We understand that the existing paving materials would ideally be milled to create a blended materials with a gradation comparable to class 5 aggregate base and used to support the new pavements. Whereas the materials below the bituminous appear to consist of materials which are dirtier and less gravelly than conventional aggregate base, we presently recommend limiting milling to the asphalt layers.

After milling, the milled materials would presumably be graded to the site and the existing subgrade soils would then be excavated as needed to attain bottom of pavement elevation. The exposed soils are expected to consist of silty to clayey sands with varying amounts of gravel. We recommend scarifying and compacting the exposed soils to even out any localized discontinuities in the subgrade soils and provide a more gradational transition between differing materials. This action is intended to limit differential frost heave and provide more uniform pavement support.

Subgrade soils should ideally be compacted to 100% of the material's maximum standard Proctor density in the upper 3 feet and to at least 95% below that depth. Regardless of densities, completed subgrades should be able to pass a test roll prior to paving. If subgrades are unstable and time constraints do not allow for drying, soil corrections, breaker run, sand subbase, extra aggregate base, and/or geotextiles may be necessary to produce stable subgrades.

MINNESOTA IOWA WISCONSIN	
--------------------------	--

Febru

E.2. Pavement Design

As mentioned earlier, the pavement subgrade soils are expected to primarily consist of silty to clayey sands. The effective Hveem-stabilometer R-values typically range from about 20 to 40 for these soil types. We recommend using an R-value of 20 for pavement design.

Based on an assumed traffic volume of 300 AADT, an Equivalent 18-kip Single Axle Load (ESAL) of about 35,000 was estimated over a 20-year pavement design life – which is very is close to the minimum equivalent traffic value included in MnDOT 7-ton pavement designs.

Further based on an R-value of 20, the assumed ESAL, and MnDOT's Flexible Pavement Design Spreadsheet calculator entitled (Typical) MnDOT Flexible Pavement Design R-value Method, we suggest a flexible pavement section consisting of at least 3.5 inches of asphalt over at least 8 inches of MnDOT Class 5 aggregate base.

We understand that the typical City of Lindstrom street section includes placement of a 1-foot layer of clean sand below the paving materials as well as edge drains. Our understanding is that this is not incorporated in the existing street section. Based on the data, the recommended pavement section described provides greater overall strength than the existing pavement and would not significantly benefit from either edge drains or an additional sand layer below the aggregate base.

The pavement recommendations provided should be considered preliminary, subject to review by the civil engineering consultant, and their experience with pavement design and performance in the area of the project. Adjustments may be deemed warranted during construction to address conditions exposed during constructed or affected by weather or other factors.

F. Construction Testing and Documentation

F.1. Earthwork

Earthwork can likely be accomplished with a variety of equipment, provided subgrades are not overly wet and soft at the time of construction. Standard vehicles with tires will likely have difficulty traversing the site under such conditions.

A backhoe or excavator with a smooth-lipped bucket is recommended for completing excavations within soil. This is intended to limit disturbance to the supporting soils being left in place, while also providing a smooth working surface.

F.2. Compaction

Fill should be placed in lifts adjusted to the compactor being used and the material being compacted. We recommend limiting lifts to no more than 1-foot – assuming large, self-propelled or tow-behind compactors are used. Thinner lifts should be used for lighter compaction equipment.

MINNESOTA	LOWA	w	Τ	S	С	0	Ν	S	IN	1
	10			~	~	~			• •	

F.3. Cold Weather

If the earthwork occurs during freezing temperatures, good winter construction practices should be used. No frozen fill should be used nor should structural filling take place on frozen ground.

F.4. Construction Phase Testing and Documentation

Excavations, grading, and roadway subgrades should be evaluated and documented by geotechnical personnel after the unsuitable materials are removed and before the placement of any new fill or pavements. Samples of any materials proposed for use as fill should be submitted for approval prior to its use during construction. The City may wish to have, or may be obligated to have, tests performed regarding the other various paving components. Specification of such requirements is normally the responsibility of the City and their design consultant.

G. Level of Care

The services provided for this project have been conducted in a manner consistent with that level of care and skill ordinarily exercised by members of the profession currently practicing in this area, under similar budget and time constraints. This is our professional responsibility. No other warranty, expressed or implied, is made.

MSA Engineer's Report

To:	Honorable Mayor and City Council Members
	Ms. Melissa Glenna, Interim City Administrator
From:	Jon Herdegen, P.E. – City Engineer
Subject:	South Lindstrom Lake Sanitary Sewer Lining
Date:	April 12, 2023 – For the April 20 th City Council Meeting

South Lindstrom Lake Sanitary Sewer Lining

Staff has been working on developing conceptual plans to conduct a lining project on a portion of the City's sanitary sewer collection system along South Lindstrom Lake. This section of the collection system is constructed mostly outside the public right-of-way and is difficult to access/maintain. Given the close proximity to the lake, it is also highly susceptible to ground water infiltration. Attached is a site plan of the areas that is currently being studied. The Project is currently divided up into three (3) phases:

<u>Phase One:</u> Install approximately 1,700 feet of cast in place pipe (CIPP) liners from Park Street to Newell Avenue (through Beach Park). The total project costs for this phase is estimated at \$275,000.

Phase Two: Install approximately 780 feet of cast in place pipe (CIPP) liners from the end of Newlander Avenue northwest round Lindstrom Lake. The total project costs for this phase is estimated at \$115,000.

Phase Three: Install approximately 22 cast in place pipe (CIPP) short liners up the first 10 feet of each lateral line connected to the sewer main lined during phases 1 &2. The total project costs for this phase is estimated at \$160,000.

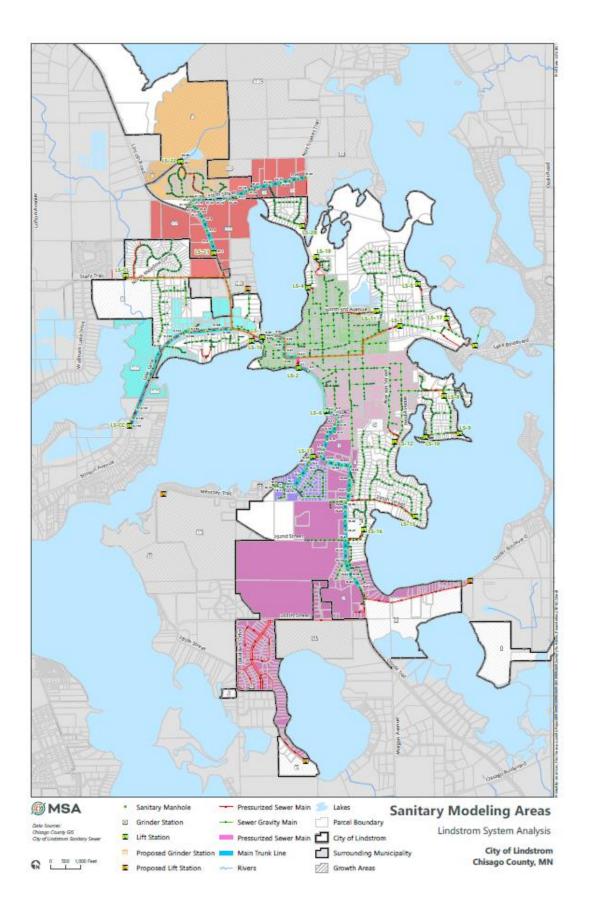

Staff considers these improvements to be the highest priority sanitary sewer project and propose to fund the project through the City's sewer enterprise fund (SAC). Before proceeding with this project, we would like to pause and solicit Council feedback before presenting a formal design/construction proposal.

Action Requested: Staff is soliciting Council feedback if this project should be discussed at an upcoming work session or if staff should bring a formal design scope and proposal to our next Council meeting for review and consideration.
